## **Data Flow Diagrams:**

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored

## **User Stories**

Use the below template to list all the user stories for the product.

| User Type              | Functional<br>Requirement<br>(Epic)                             | User Story<br>Number | User Story / Task                                                                                                                       | Priority | Release  |
|------------------------|-----------------------------------------------------------------|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|----------|----------|
| Customer<br>(Web user) | Create flask<br>project, IBM<br>account, Docker<br>and SendGrid | USN-1                | Getting started with flask, creating IBM cloud account and installing IBM cloud CLI, docker                                             | High     | Sprint-1 |
|                        | Create UI to interact with application                          | USN-2                | Designing user friendly UI to make human computer interaction smoothly. Home page, log in, log out, expense report page are the console | High     | Sprint-1 |
|                        | Create IBM DB2<br>and connect with<br>python                    | USN-3                | Creating IBM DB2 connecting it with flask MVC microframework to store the user credentials and expenses.                                | Low      | Sprint-2 |
|                        | SendGrid<br>integration with<br>python code                     | USN-4                | Generating SendGrid APIE to notify user that they reach the limit of spending.                                                          | Low      | Sprint-2 |
|                        | Containerize the app                                            | USN-5                | Creating docker file and testing the requirements for the flask application.                                                            | Medium   | Sprint-3 |
|                        | Upload image to IBM container registry                          | USN-6                | Upload images used in the front end to Container registry.                                                                              | High     | Sprint-4 |
|                        | Deploy in<br>Kubernetes                                         | USN-7                | Deploy the application after testing its functionality on Kubernetes.                                                                   | High     | Sprint-4 |
